NS6130-12-001596

Bentonite clay, also known as montmorillonite clay or calcium bentonite clay, is an ancient home remedy that is used for a variety of skin issues. It is a fine powder obtained from volcanic ash. Bentonite clay is natural clay with a fine, soft texture. It creates a paste when mixed with water. Two main classes of bentonite exist such as sodium and calcium bentonite for industrial purposes. Bentonite clay can be utilized for medical or cosmetic benefits, for instance treating rashes and acne or as a hair mask. It is used in drilling fluids to cool the cutting tools and lubricate, to remove cuttings, and to help prevent blowouts. It is used for decolorizing various mineral, vegetable, animal oils and also used to absorb oils and grease.

CAS
1302-78-9

Technical Specification

Molecular Weight	Specific Gravity	Melting Point	APS
108.1 g/mol	2.5(H ₂ O)	Decomposes	40-60µm

Applications

- Medical
- Cosmetic
- For decolorizing
- Absorb oils and grease.
- Iron and steel foundries
